

Abstract of the Disclosure

011 Existing hand held Quick-Grip® bar clamps that are sold on the market have a limitation in the distance away from the clamp bar that two objects can be clamped. This limitation is the distance that the Quick-Grip® bar clamp heads are located from the front of the clamp bar. This invention is designed to slide over the heads of these existing clamps and extend the distance that two objects can be clamped together away from the Quick-Grip® clamp bar. This is new in that the original function of the Quick-Grip® bar clamp remains the same with the extension arms in place or with the extension arms removed. These extension arms are easily installed by hand and removed by hand. The clamp extension arms can be used in a reverse position to be used when the Quick-Grip® bar clamp is in the spreader position.
